Such Women Just Have to "Give Up"

"Man may work from sun to sun, but woman's work is never done." That's why women are overworked, nervous, all run down, no appetite, and can "hardly drag around." Vinol creates a hearty appetite, strengthens the digestive organs, induces sound sleep, invigorates the nerves, and in this natural manner creates working strength.

Narragansett Pier, R.L.

"I was all run-down, back ached, and tired all the time. I keep house for my husband and four children and could hardly keep around. Finally I tried Vinol and it has restored my health and helped me wonderfully, so I recommend it to others who are in this condition." Mrs. Hannah Randall.

For all run-form, percent, anaguic conditions, week wamen, overwerked meaning the state of t Jacksonville, Ill.

roadway Pharmacy, G. G. Eagler, Prop., Norwich. Vinol is sold in Williams Inarmacy, and in Putnam by J. F. Donahue and Druggists Everywhere.

AGRICULTURAL INTERESTS

Farmers hardly realize the loss they suffer each year from smut in oats. At blooming time they see many blasted theads, but the other plants soon outgrow them and they are passed by unnoticed. Yet there may be a loss of ten per cent. or more of the crop. The loss is easily prevented, says Henry Dorsey, agronomist for the extension service of Connecticut Agricultural Connecticut Agricultural Storrs. ollege at Storrs, Seed oats should be treated with for-

College at Storrs,
Seed oats should be treated with formalin to kill the spores of the smut. One pint of formalin is enough to treat forty bushels of oats. There are various ways to apply it. One way is to mix the pint of formalin with thirty or forty gallons of water, and sprinkle over the oats until each grain is moistened.

As a gallon of liquid is enough for a bushel of oats, it is only necessary to imake up enough of the solution to treat the required amount of seed. Thus, one-quarter of a pint of formalin in seven and one-naif to ten gallons of water will treat ten bushels.

A good way to do the sprinkling is to have the oats in a pile on a clean floor with one man to shovel them over and over as another sprinkles the salution over them. Atter all the oats in water ways, even

for and over as another sprinkles the blution over them. After all the oats are moistened they should be covered ith blankets and sacks to retain the as generated by the solution. Leave as generated by the solution. Leave are cover on the pile of oats for six reight hours when it should be recovered and the oats dried. oved and the oats dried. Do not let the oats heat in the pile.

THE TAPE LINE TESTIFIES.

Three counties in Connecticut, Hart-ord. New Haven and Fairfield, have larged directions, where these crops lenned educational milk campaigns will survive the winter, they can be nder direction of their farm bureaus, sown the previous fall. There are a No more convincing proof of the large number of valuable hog forages value of milk in the diet of children which may be grown in the South conducted for several months by the home demonstration agent in Manatee county, Fia. She has weighed and measured over 2,000 children, and has found that those weighing and measured over 2,000 children, and has peanuts, chufas, sweet potatoes, the standard or a little. To make hog production most profitring up to the standard, or a little able, pasture should be provided whenreceiving a great deal of milk. The children much under the standard have been receiving little or no milk. Carrybeen receiving little or no milk. Carrybeen receiving little or no milk. Carrybeen receiving hittle or no milk carryweight children began almost immelittle use reduces the cost of producing gains. In addition, it keeps the animals in good thrifty condition. died to their diet. With such evi-ence as to the value of milk it is not cereals, are best utilized in the early urprising that Manatee county has nore dairy cows now than a year ago, nd the number is rapidly increasing. has spring, and forage crops such a ago, corn, sey beans, cow peas and, in the The results of this experiment are being used as one of the arguments in a there is a season during which festate-wide campaign for more dairy temporary pastures are available.

THE MANAGEMENT

MANAGEMENT
OF PERMANENT PASTURES
and a not reliab grasses expenses
their greatest use. They do not fur-Hogs do not relish grasses except nish grazing as early in the spring hen the leaves are young and tenas do the cereals previously mencr. Hence it is necessary, for the tioned, but they grow better during hen the leaves are young and ten- as do the cereais previously the cere. Hence it is necessary, for the tioned, but they grow better during est results, to keep permanent pasures well stocked. It is usually adabundance of forage at a season shall be to have some other stock in the astures with the hogs to eat the coarer plants. Cattle are best suited
or this purpose. Mowing the pasture
in late spring should be practiced if
the plants become too far advanced.

In most cases it is advisable to have
one of the best supplementary for ome of the best supplementary for-ge crops to graze in addition to the asture. A safe rule is to have at least he acre of good permanent pasture or each brood sow kept. Of course, its acreage could be reduced or the with a shovel amounts to an applica-tion of two tons per acre. the time of planting, and the sheppard is up through the night disturbing the flock from time to time in order to se-cure the greatest possible amount of

CARE OF THE HOTBED.

Hotheds need plenty of water when danied, and it is better that it be given small ones. Continue watering so long as the soil will absorb it read-ily, and then watch the soil and do not epeat watering until the ground is dry mough to crumble at a touch when pressed into a ball. The surface should be stirred to admit air, and to make this possible the seeds should be planted ed in rows. The seeds can be planted thickly in the row, but the rows should not be closer than three inches to admit of stirring the soul

In setting plants in the cold frame, hev should be placed equal distances ach way and they can be stirred both ways to advantage. In all stages of rowth, frequent stirring of the soil is mportant, for air at the roots is necis apt to have a crust form on

surface is apt to have a crust form on it quickly.

When covered with glass, both the hot-beds and the cold frames must be watched closely, for the heat is very apt to run up fast while the sun is shining bright. It is a good plan to have a thermometer in the bed and when it registers above 80 degrees on the shady side of the board the sash should be opened a little, no matter bow cold the day. A close watch will enable one to control the heat and judge when air is needed. All the air possible should be given and the tempossible should be given and the tem-perature, kept up to a growing heat and toward the last the sash should be left off as much as possible. Let the plants have every warm, slow rain, for no sprinkling can do them an equal

amount of good. amount of good.

The same hotbed can be used over and over in the spring, for many of the plants need not be started until the tomatoes and peppers are in the cold frames. Early cabbage can follow, and when it is put in a cold frame later cabbage may be grown in the bed to be set directly outside. If the seedbed is made right, the heat will last all through the season. In this way the same bed is used for later plants.

EGGS IN WATERGLASS. During the past two years, freshing prices from August 1st to March 1st have averaged twice as high as the lowest spring prices. Cold stor-age reports from 1918-19 show that eighty-four per cent, of all the eggs stored went in between April 1 and May 31. This, then, must be the season of lowest prices. The cost of preserving eggs at home should not exceed three cents per

such soil will usually become diseased and die or else will remain stunted and sickly. It is because of the transplanting of such diseased seedings in the home garden occur. Every gardener should therefore learn how to recognize troubles of young plants and become familiar with the method here described for preventing them.

Before treating the soil it should be blaced in the box for drainage. Pour on the boiling water slowly at the rate of two gallons to a box of soil one foot square and the sum of the square and the square and the square and the square and the square for lack of a school.

And when the land is redeemed the government should let the loops take it under the homestead act or buy it on long time and casy terms.

The waster

Why We Sell

The ROUND OAK

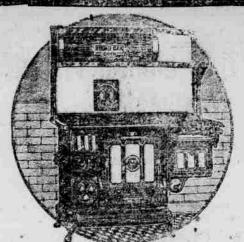

Combination 3-FUEL RANGE

of the ever-increasing demand for a combination coal and gas range that is compact-that saves space in the kitchen-that makes the home warm and cozy in the bleak, cold winter, yet keeps cool and comfortable in the stilling, hot summer-a single range that makes possible all the conveniences and cooking facilities of both coal and gas, separately or togetherthat will remain sightly with little care-that costs less than the two good and complete ranges it represents.

Because the Round Oak 3-Fuel Combination Range is equipped to operate perfectly with not only coal and gas, but provision is made for burning wood as long as 24 inches without the usual change of fire-box fixtures. It occupies no more space than is required for the average range, burning only coal. it assures maximum comfort every season of the year. A single large oven bakes perfectly with any or all fuels-coal or wood in the winter, gas in the summer-separately or together. A full-sized, five burner gas top and broiler-in addition to the large coal part-assures the utmost convenience. So simple that any woman will instantly grasp the principles of its operation. It is safe in the hands of anyone. Requires no blacking. Highest-grade materials, superior construction, ample weight, and splendid fitting, guarantee economy and long life.

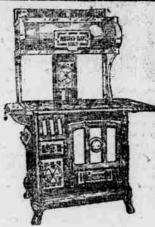

Because the Round Oak 3-Fuel Combination Range represents a wise and excellent investment to anyone now using just one fuel, but who wish to enjoy the conveniences of the others-one or both. Those who cook only with gas will readily concede the advantage of this combination as a "house warmer" on the chilly days of early fall and spring, when it isn't quite cold enough to run the heating plant steadily. Those who have gas in the home-who expect to cook with gas "sometime" -those who are "getting along" with gas "hot plates"-those who need or want more room in the kitchen-and those who must soon replace an unsatisfactory coal or gas rangeeither or both-will find the Round Oak 3-Fuel Combination Range an investment that pays countless dividends in an inreased convenience, comfort, and fuel economy. And bacause NOW-of all times-it is the ONE range that is BEST adapted to the present fuel and food conditions!

DEMONSTRATION AT OUR STORE BEGINS THURSDAY, APRIL 10th
